The bcm Mobilator

The missing link has now been developed!

Over the last 10 years bcm transtech a/s has been working closely and intensively with our leading customers in the corrugated industry, to develop clever systems to store and handle:

- Flexo Printing Stereos,**
- Rotary Die Cutting Tools**
- Flat Bed Die Cutting Tools,**
- Flexo Printing Stereo Washing Machine**
- Empty pallet handling.**

A large and progressively growing reference list – as well as all the positive feed back comments we have received from our customers - has clearly shown us, that the comprehensive bcm storage- and handling system solutions really have achieved excellent results such as :

- **Safe storage**
- **Simple retrieval of tools and stereotypes**
- **Elimination of damage when moving between storage and machines**
- **The safest and most efficient use of valuable floor space available today for storage**
- **Elimination of manual handling problems**
- **Cost savings relating to personnel, time and machine set up efficiencies**

With more and more interest from existing and potential customers from the corrugated industry, we have been asked by some:

To fulfil the system with a Flat Bed Die Handling Mobilator.

The bcm mobilator has been developed in cooperation with leading die makers and box makers in Europe. Using the mobilator, Flat Bed Die Cutter operators can now take the die directly out from the bcm flat bed die storage cassette in a vertical position - turn the die into a horizontal position - and place the die on the turntable.

Even if we are lifting the die in less than 25% of the length of the die of a maximum size, a specially developed stability system ensures that the die does not bend in the floating horizontal position – and will therefore not be damaged as it turns from vertical to horizontal position.

In addition to handling of the die cutting tool, the mobilator can also handle the male stripping tool from the bcm cassette, via a working table, and directly into the flat bed die cutter-stripping section. Most of the female stripping tools can also be handled by the mobilator.

After box production the operator will - via the mobilator - take the die back from the turntable into the bcm cassette as well as the stripping tools.

The bcm mobilator is built as an extra to the well known bcm cassette - and rotary die handling crane and the bcm mobilator covers the full platform area in front of the flat bed die cutting machine.

Advantages of investment in the bcm flat bed die mobilator include:

- **Saving of unnecessary expenses for manpower around the flat bed die cutter to move tooling.**
- **No more heavy and dangerous lifts for the operators to handle the flat bed die cutting tools.**
- **Careful and profitable handling of the dies through reducing damage.**
- **Health and safety standards will be increased.**

bcm was in 1999 rewarded with the second price for "The Most Innovative Technical Development" by F.E.F.C.O. The - European corrugated board manufactures organisation for our unique Die cutter- and Stereo storage systems for the Corrugated Industry.
